2016csb1058@iitrpr.ac.in

Abstract—**In this report I want to decsribe a problem and its proposed solution.As we all know that for various government jobs,applications for institutions and many other services for the government are needed to get the applicants to upload there credentials on the internet and it consumes a lot of server space and a time from the user when he has to apply for various differet programmes.**

I. INTRODUCTION

While applying for different recruitments through online application softcopy uploading of documents like educational qualification, D.O.B proof, category certificate etc. of candidate is required.This result in unnecessary utilization of server space as each application requires approximate 2MB storage space and thousands of applications are received.If credentials are verified then and there at the time of application receiving (uploading), it will be beneficial for all stakeholders.Moreover if the details required for the forms are available through the pictures itself using image processing and computer vision.

II. IMPLEMENTATION DETAILS

We can surely solve this problem by having a single database for each in indiviusual for the caste certificates,D.O.B certificates and other essential detais required folr that particular situation and can give the applicant a choice to fill the details manually or upload the images of documents needed and verify the details filled by the website.

- We can use the state of the art techniques already present for the computer vision and indentifiying various details required for the forms.
- We can create a dummy database for just the demonstration and implement the website for that.
- The forms can be customized as to which fields we want to get details from the images itself.
- The details declared as essential for the credibility of the applicant can be verified at that instant itself.

III. IMPACTS ON THE SOCIETY!

- It will be very easy for the applicants as now they need not waste their time in filling out all those obvious details.
- It will save a lot of the server space and be very crucial for the space mangement.
- It can be used by any similar kind of activity which requires details of the applicants .

IV. TECHNOLOGY STACK

For this project estimated tools needed for the project are listed below:-

- PHP for handling the forms and the server side.
- MySQL for handling the datbases needed.
- HTML,CSS and Javascript for front end development of the website.
- OpenCV for using the computer vision,image processing and related features.
- Maybe more to be discovered.
